**The investigation of the hBCAT proteins in control and
diseased human brains: Implications for glutamate toxicity
in Alzheimer's disease**

Jonathon Walter Hull

Department of Biological, Biomedical and Analytical Sciences, University of the
West of England, Bristol

2014

A thesis submitted in partial fulfilment of the requirements of the University of
the West of England, Bristol for the degree of Doctor of Philosophy

This work was funded by BRACE (Bristol Research into Alzheimer's and Care
of the Elderly) and carried out in collaboration with the South West Dementia
Brain Bank (SWDBB)

This copy has been supplied on the understanding that it is copyright material
and that no quotation from the thesis may be published without proper
acknowledgement

Acknowledgments

My deepest gratitude goes to Myra Conway (director of studies) for an amazing amount of support, understanding, **patience** and intelligence. I could never have done this without her (although I'm sure she knows that). I would also like to thank the people of BRACE (Bristol Research into Alzheimer's and Care of the Elderly) for the funding of this PhD – I hope they find it a worthwhile investment.

At the South West Dementia Brain Bank I would like to thank Katy Chalmers (second supervisor), Seth Love, Patrick Kehoe and Scot Miners. I would also like to make a note of thanking the families of those who donated their brain for dementia research – their contribution to science should not be overlooked.

At the University of the West of England I would like to thank Carolyn Paul (second supervisor), along with Katy Hayward, Mohammed Hezwani, Maya El Hindy, David Corry, Oesther Odele, Patsy Adamo, Alison Haliday, Man-Kim Cheung, Mathew Harris, Vinood Patel and many more that I've almost certainly forgotten.

I'd finally like to sincerely thank my family for their continued support, and hope they don't find my thesis too boring.

The investigation of the hBCAT proteins in control and diseased human brains: Implications for glutamate toxicity in Alzheimer's disease

Abstract

Introduction & Aims: The distribution of the BCAT proteins has been extensively mapped in rodent models, and metabolic studies have established that BCAT transamination in the rodent brain is responsible for 30% of *de novo* glutamate synthesis. However, to date the BCAT proteins have not been mapped to the human brain and their role in pathogenic conditions where glutamate toxicity features has not been investigated. To this end, this study aimed to map the hBCAT proteins to several brain regions. Furthermore, the expression of hBCAT in AD relative to matched controls was investigated and correlated with both physiological and pathological features of AD. Finally, metabolic and inflammatory stimuli were examined for their effect on neuronal expression of hBCATc.

Methods: Distribution of the hBCAT proteins were assessed utilising immunohistochemistry and imaged utilising a 12-bit camera mounted on a Leica DM microscope. Western blot analysis and microscopy determined the expressional difference in AD compared to age and gender matched controls in addition to cell types responsible for the increased expression. Further investigation of neuronal hBCATc expression was examined in the immortal cell line IMR32 utilising Western blot analysis, phase contrast microscopy, flow cytometry and ^{14}C radiolabelled activity assay.

Results & Discussion: For the first time this work demonstrates key differences between the animal model of BCAA metabolism and humans. All brain regions contained cell types labelled for hBCATc and hBCATm. However, while this work mirrored animal models in that hBCATc was localised specifically to neurons, hBCATm was absent from astrocytes and instead labelled the vasculature – contrary to animal models. Another novel finding of this work links altered aminotransferase expression to AD pathology. An increase of hBCATm expression of +117% ($p = 2.29 \times 10^{-4}$) and +143% ($p = 7.70 \times 10^{-5}$) in the frontal and temporal cortex of AD subjects relative to matched controls demonstrates the disease association of hBCATm. A non-significant increase of 32% was observed for hBCATc in the frontal region. With hBCATm expression correlating with Braak stage in both the frontal ($p = 1.2 \times 10^{-5}$, $\rho +0.468$) and temporal ($p = 3.4 \times 10^{-4}$, $\rho +0.391$) cortex this work posits that altered BCAA metabolism is occurring simultaneously with AD progression and may be a novel therapeutic target for the treatment of dementia. Another novel aspect of this work also demonstrates cell surface expression of hBCATc and relates this to mTOR signalling. Altered cell surface and protein expression was investigated with functional activity. Together this data demonstrated expressional, functional or activity changes in hBCATc due to glutamate, insulin, leucine, TNF α and IL1 α .

Abbreviations

α KG – α -Ketoglutarate

AD – Alzheimer's disease

ADP – Adenosine diphosphate

ALS – Amyotrophic lateral sclerosis

APS – Ammonium persulphate

ATP – Adenosine triphosphate

BBB – Blood brain barrier

BCAA – Branched chain amino acids

BCKA – Branched chain α -keto acids

BCKD – Mitochondrial branched chain α -keto acid dehydrogenase enzyme

Bim – Bcl-2 interacting mediator of cell death

BOD – Bcl-2 related ovarian death gene

BSA – Bovine serum albumin

BV – Blood vessels

CHAPS – 3-[(3-Cholamidopropyl) dimethylammonio]-1-propanesulfonate

CSF – Cerebrospinal fluid

Cys – Cysteine

DAB – 3,3'-Diaminobenzidine

DAPI – 4',6-diamidino-2-phenylindole

DIOC6 – 3,3'-dihexyloxycarbocyanine iodide

DTT – Dithiothreitol

EAAT – Excitatory amino acid transporter

EBM – Eagles basal media

Abbreviations

- EGM – Endothelial cell growth media
- EDTA – Ethylenediaminetetraacetic acid
- EGTA – Ethyleneglycoltetraacetic acid
- ER – Endoplasmic reticulum
- GABA – Gamma-aminobutyric acid
- GAPDH – Glyceraldehyde 3-phosphate dehydrogenase
- GDH – Glutamate dehydrogenase 1
- GLUT – glucose transporter
- Grx – Glutaredoxin
- GSNO – S-nitrosoglutathione
- GSH – Glutathione reduced
- GSSG – Glutathione oxidized
- hBCATc – Human branched chain aminotransferase (cytosolic isoform)
- hBCATm – Human branched chain aminotransferase (mitochondrial isoform)
- HEPES – 4-(2-hydroxyethyl)-1-piperazineethanesulfonic acid
- HRP – Horseradish peroxidase
- IMR32 – Human neuroblastoma cell line
- IL – Interleukin
- IPTG – Isopropyl β -D-1-thiogalactopyranoside
- KIC – Ketoisocaproate
- KIV – Keto-isovaleric acid
- KMV - Keto- β -methylvalerate
- L1 – Large neutral amino acid transporter 1
- LDS – Lithium dodecyl sulphate

Abbreviations

nAChR – Nicotinic acetylcholine receptor
NADH – Nicotinamide adenine dinucleotide
NEAA – Non essential amino acids
NMDA – N-methyl-D-aspartic acid
NOS – Nitric oxide synthetase
MMSE – Mini-mental state examination
MSUD – Maple syrup urine disease
mTOR – Mammalian target of Rapamycin
mTORC1 – Mammalian target of Rapamycin complex 1
mTORC2 – Mammalian target of Rapamycin complex 2
NADPH – Nicotinamide adenine dinucleotide phosphate
NO – Nitric oxide
PDI – Protein Disulphide isomerase
PKC – Protein kinase C
PLP – Pyridoxal phosphate
PMP – Pyridoxine monophosphate
PMSF – Phenylmethyl sulfonyl fluoride
RIPA – Radioimmunoprecipitation assay buffer
RPMI - Roswell park memorial institute medium
SDS – Sodium dodecyl sulphate
TBST – Tris-Buffered Saline/Tween
TCA – Trichloroacetic acid
TEMED – Tetramethylethylenediamine
Trx – Thioredoxin

Abbreviations

TNF – Tissue necrosis factor

UO – ubiquinone oxidoreductase

ZIP – zipper interacting protein
